

NAME

join

SYNOPSIS

join a table of strings with a specified separator

USAGE

```
local du = require "lib/dtutils"
```

```
    local result = du.join(tabl, pat)
```

```
    tabl - a table of strings
```

```
    pat - a separator
```

DESCRIPTION

join assembles a table of strings into a string with the specified pattern
in between each string

RETURN VALUE

result - string - the joined string on success, or an empty string on failure

EXAMPLE

```
join({a, "long", "path", "name", "to", a, "file.txt"}, " ") would return the string  
"a long path name to a file.txt"
```
